Why talk about a heat pump in the middle of summer...

when all you want to be is cool.

Simply because the heat pump is the most efficient, low-cost heating and cooling system on the market. In partnership with good insulation, the heat pump means efficient energy management, the year-round. In winter, it takes usable warmth from outside air and pumps it inside to heat your home. And in summer, it works in reverse and pumps the heat out of your home.

The reason the heat pump is the most efficient heating and cooling system is because it produces two or more units of heat for each unit of electricity required to operate it. This is the kind of efficiency we need to meet the energy challenge!

So, if you're considering a new home, or are converting your present system, look into the advantages of the heat pump. Your heating-cooling contractor can give you all the details.
