

Want to know what's coming out of your tap?

www.lvvwd.com

We thought so. With all the different sources of information about water quality – from water treatment salespeople to the six o'clock news – it's understandable if you're a little cloudy about the quality of tap water. That's why the experts at the Las Vegas Valley Water District have produced a comprehensive water quality report.

This report includes information about our water sources, an overview of the water treatment process, a summary of results from more than 200,000 analyses conducted during 1999 and much more.

If you're not getting your water quality information straight from the source, here are a few things you may not know:

- ◆ **More than 97 percent of the water in Lake Mead (our primary drinking water source) begins as snowmelt in the Rocky Mountains.**
- ◆ **Southern Nevada's water treatment system is among the most advanced in the world.**
- ◆ **Every year, scientists test more than 20,000 water samples taken from throughout the Las Vegas Valley.**
- ◆ **Municipal water quality is regulated by the federal Safe Drinking Water Act—in fact, the testing requirements for tap water are even more strict than for bottled water.**

and perhaps most importantly...

- ◆ **Water delivered by the Las Vegas Valley Water District meets or surpasses all drinking water quality standards!**

If you are a Las Vegas Valley Water District customer and don't receive your report by July 1, please call our Water Quality Division at **258-3215**. We want you to know the facts about your drinking water.
